How to Configure Reverse DNS

Reverse DNS can be setup from the Bytehouse control panel (<https://control.bytehouse.co.uk>). The steps to do that are mentioned below for your reference.

- 1) Log into your Bytehouse control panel.
- 2) Click on "Reverse DNS"
- 3) Click on "New Record"
- 4) Select the Name. For example if Reverse DNS is to be setup for the IP is 188.193.158.129 then select "129.158.193.188.in-addr.arpa"
- 5) Leave TTL value as 600 and Type as PTR
- 6) Provide value as your server name if it resolves to a fully qualified domain name (if the IP has shared) or your domain name (If the IP is dedicated)
- 7) Click Save
- 8) You may perform the same step for additional entries.

For further information regarding the configuration of Reverse DNS, contact our experienced representatives at www.bytehouse.co.uk/contact.
