Backup Configuration & Legacy Backup Configuration in WHM

Web Host Management has two types of backups that are available which are Backup Configuration and Legacy Backup Configuration. To setup either of these configurations you will need to take the following steps:

1. Backup Configuration
2. Legacy Backup Configuration

These two types of backups are independent from one another and it does not make any sense to enable at the same time.

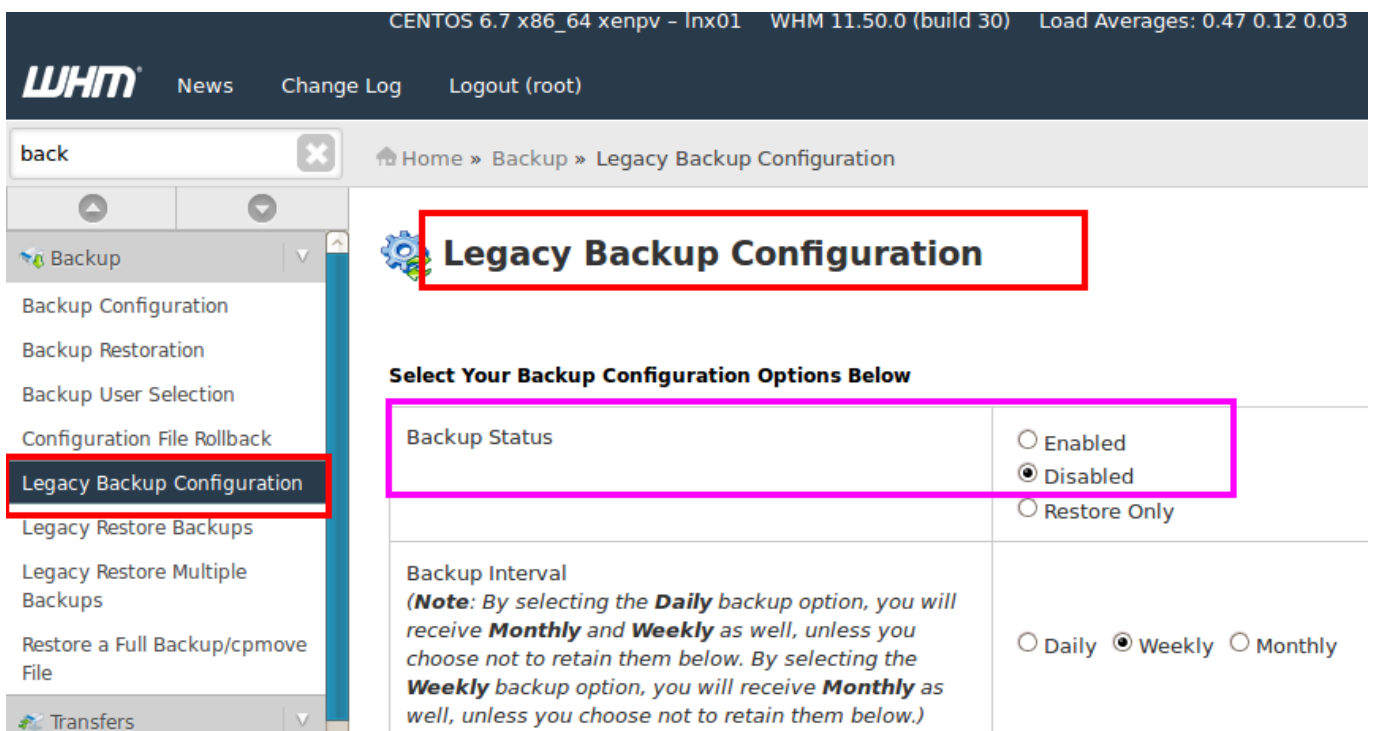

What we do need to accomplish is enabling either Backup Configuration or Legacy Backup Configuration as we need and as are comfortable with.

Why do two backups exist?

ByteVault

Legacy Backup configuration is the backup settings that originally were found in the old original version of WHM. When WHM evolved, a new kind of backup configuration replaced “Backup Configuration”. At that specific time, WHM did not remove the old type of backup settings but instead renamed it as “Legacy Backup Configuration”.

1. Legacy Backup Configuration

When you click on Legacy Backup Configuration in the WHM system, you will see to your right that the backup status has been disabled.

2. Backup Configuration

The screenshot shows the WHM interface. At the top, there are navigation links for 'News', 'Change Log', and 'Logout (root)'. Below this is a breadcrumb trail: 'Home » Backup » Backup Configuration'. A sidebar on the left contains a menu with 'Backup Configuration' highlighted in red. The main content area is titled 'Backup Configuration' and features a blue notification box stating: 'The legacy backup system is currently disabled. Click here to manage the legacy backup system.' Below this is the 'Global Settings' section. Under 'Backup Status', the 'Disable' radio button is selected and highlighted with a red box, while the 'Enable' radio button is unselected. To the right of this setting is the text: 'This option will enable or disable backup activity.' Below 'Backup Status' is the 'Backup Type' section, with 'Compressed' selected and 'Uncompressed' unselected. To the right of this setting is the text: 'This option saves all of your information, and uses less disk space, but it takes more time to complete.'

When you click on the Backup Configuration in the WHM system, you will see that the Backup Status in Global Settings has also been disabled.
